NEW!

TFC

The next generation of diamond cutting tools

We have TFC-Solid CVD diamond tipped tools on offer. This innovative new program of cutting tools from Becker has wear properties increasing toollife by 2-fold to 10-fold compared with PCD. This new diamond is grown in a chemical vapour deposition reactor with a thicknesses of 0.5mm - 1.8mm without binders, which allows for an extremely sharp cutting edge and thus an excellent surface finish without cutting pressure. The absence of binders at the cutting edge allows for excellent thermal conductivity which dissipates heat produced at the cutting zone. With this technological advancement of cutting materials, the technology of tool manufacture has also evolved drastically. All segments we produce are brazed onto carbide in a high vacuum brazing process that ensures excellent quality. Due to its extremehardness, the cutting edge cannot be ground or eroded. Therefore we have invested in high tech lasers which not only finish cutting edges of the highest quality, but which also allow 3D chip breaker lasered into various designs.

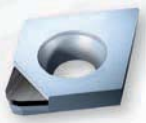
Your advantages

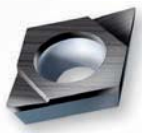
- First class compound materials
- Extreme hardness
- Dramatically-improved toollife
- Improved surface finish
- Reduced cutting pressure

Suitable for the following materials

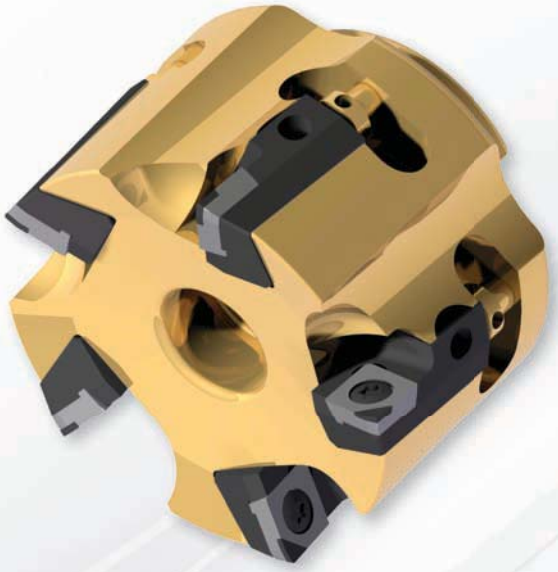
- Aluminium alloys (8 - 40% Sic)
- MMC
- CRP (up to 80% carbon fibre)
- GRP (up to 80% glass fibre)
- Plastics
- Brass, copper, bronze
- Cast iron with vermicular graphite

Contents





ultrahard
cutting materials



Dear customers and business partners,

The great challenges of future cutting techniques can only be mastered by ultra-hard cutting materials. For decades have we been pioneering the development and production of efficient cutting tools made of diamond and PcBN. Our tools are practically applied in all industries world-wide, for example in automotive engineering and associated suppliers, aircraft and engine construction, mechanical engineering, precision engineering and medical engineering.

On the following pages of our new catalogue we give you an exclusive introduction of our cutting tool range with diamond cutting edges: We have extended our range by two further diamond cutting materials to a total of five, which comprises the solid CVD-diamond known as our international registered trademark TFC as well as the new solid PDC-grade PDC-CU-S. It goes without saying that this will set new standards in cutting technology with diamond cutting edges. At the same time we will present the latest developments with our broad standard range of 3D-chip breaker geometries as well as the extensive application of laser technology. We would like to emphasise our unrestricted effort to research and develop new cutting technologies using diamond cutting materials.

You have any queries or suggestions, or you wish to receive our catalogue on PcBN cutting tools?

Then please feel free to contact us.

Sincerely,
Becker Diamantwerkzeuge GmbH

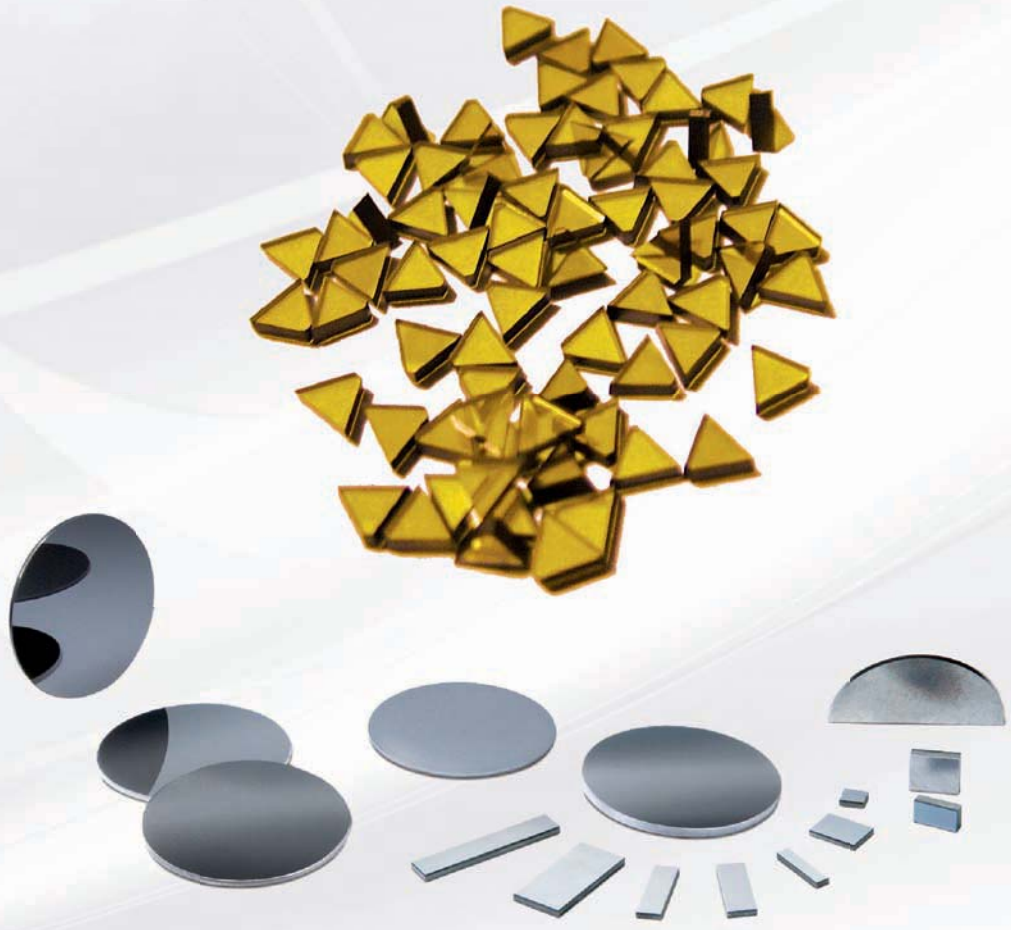
2200 years of diamond research and development

From engraver to high-tech tool

For over 3000 years diamond has been known to mankind as the hardest existing mineral. Until this day it still is the most treasured gemstone in the world. Even in early times this gem, crystallised of pure carbon, was used as a tool. Archaeologists have found proof dating back 200 years BC that unprocessed diamond was used as engraver even then. Later on the polishing technology came into development for the moulding of diamond blanks. During the Second World War the demand for natural diamonds has risen unexpectedly in all industries, thus the continuing need for diamonds soon exceeded the amount extracted from natural resources.

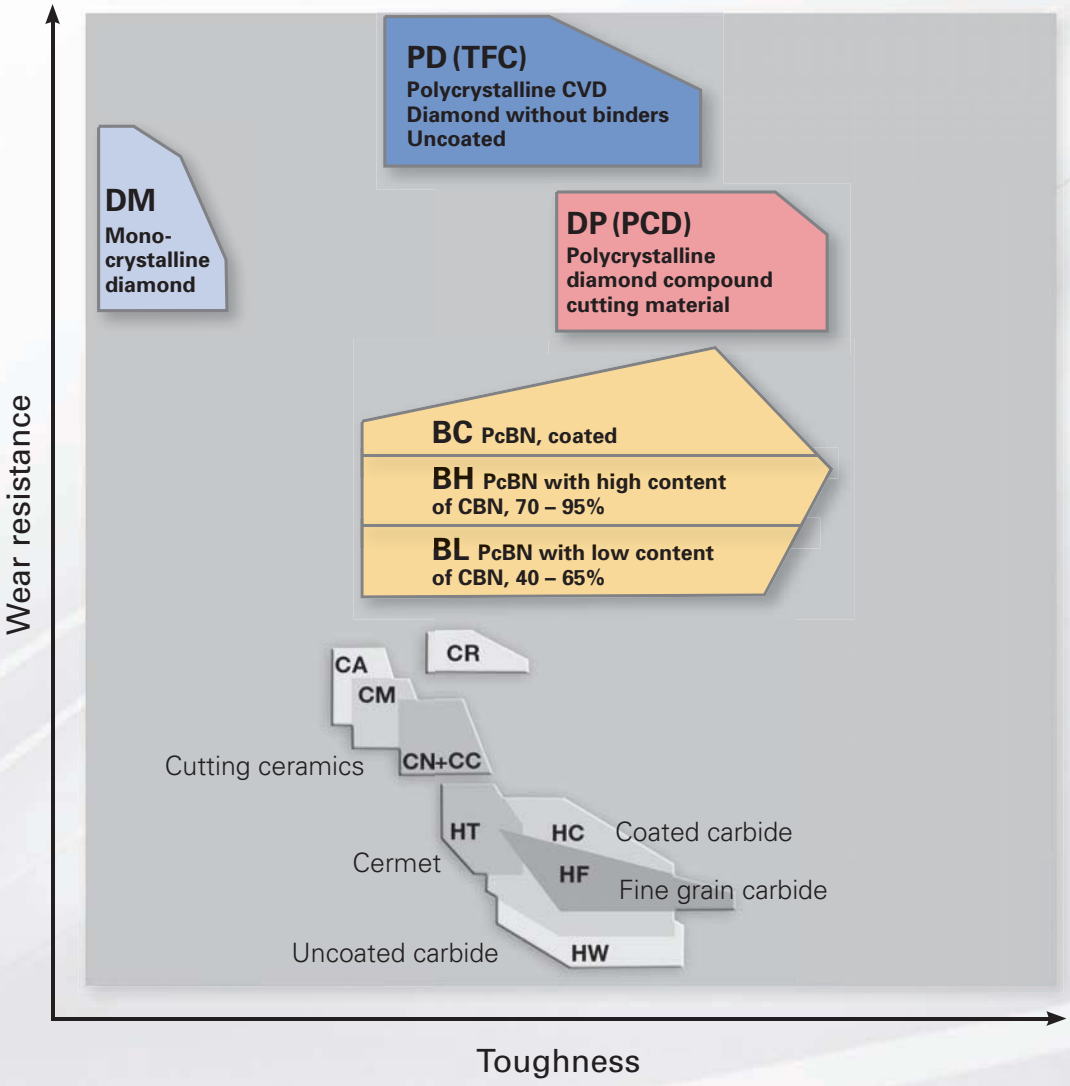
The synthetic diamond was born

The first real synthetic diamonds were crystallised in Sweden by ASEA in 1953. The General Electric Company in the USA was second to announce the successful results of their research in 1955. Synthetic diamonds are nowadays being produced as monocrystalline stones (MDC), polycrystalline Solid-CVD blanks (TFC) and as polycrystalline diamond compound material (PCD). The global demand of these ultrahard cutting materials is on a constant rise. In all modern machining, diamonds and cubic boron nitride have become cutting materials that are simply indispensable.



ultrahard
cutting materials

Groups of cutting materials (DIN ISO 513)



Additional ISO designation codes for carbide (also Cermet) and ceramics have been added to the DIN ISO 513 (2001) standard. Furthermore new ident letters for the ultahard cutting materials polycrystalline cubic boron nitride, monocrystalline and polycrystalline diamond have been introduced.

HW = Uncoated carbide **HF** = Fine grained carbide **HT** = Cermet, TiC or TiN **HC** = Carbide / Cermet as above, but coated	**DM** = Monocrystalline diamond **DP** = Polycrystalline diamond-compound **PD** = CVD - thickfilm diamond
CA = Ceramics, main content Al_2O_3 **CM** = Mixed ceramics, main content Al_2O_3, plus components other than oxides **CN** = Siliconnitride ceramics, main content Si_3N_4 **CR** = Ceramics, main content Al_2O_3 reinforced **CC** = Ceramics as above, but coated	**BL** = Polycrystalline Cubic Boron Nitride with low content of CBN (40 – 65%) **BH** = Polycrystalline Cubic Boron Nitride with high content of CBN (70 – 95%) **BC** = Polycrystalline Cubic Boron Nitride as above, but coated

New ultrahard diamond cutting materials and their processing

Technical advancement never stands still. Fortunately we can present various new developments in regard to cutting tools. The diamond cutting edges will expedite the processing of nonferrous metals and plastics of all kinds into unknown dimensions.

First of all we would like to introduce new monocrystalline diamonds manufactured under the HPHT technique. The diamonds weigh between 0.8 and 3,5 carat and completely substitute the established natural diamond up to cutting edge lengths of 7mm.

Furthermore we can present the production and professional processing of polycrystalline TFC-solid CVD diamond with thicknesses between 0.5 and 1.8 mm. Since this pure diamond material without any binder cannot be eroded or economically ground, the only remaining machining procedure is the newly-developed laser technology.

The required segments are cut by laser. After the high vacuum brazing process the cutting edges are also treated by laser both in the periphery and on the top rake with or without a chip breaker geometry.

We are the world's market leader for full machining of diamond cutting edges by laser technology.

Diamond grades in comparison

Becker-Designation	ISO-Designation	Characteristics	Application
MDC	**DM**	Solid monocrystalline diamond with no structure. Cutting edge extremely sharp and without microdamages, generating no cutting pressure, allowing burr free results with tolerances close to zero ± 0.001 mm. Flank extremely wear resistant and maximum thermal conductivity (HSC and HPC), low toughness.	Superfinishing of all pure nonferrous metals and nonmetallics with no abrasive reinforcement or silicon. (HSC-High Tech)
TFC	**PD**	Solid polycrystalline CVD-diamond without binder and without carbide reinforcement, perfect cutting edge sharpness and cutting edges without any microdamage. No cutting pressure and smallest tolerances. Highest wear resistance and very high thermal conductivity (HSC and HPC), higher toughness.	From super finishing to semi finishing of all nonferrous metals and nonferrous-composites with high content of abrasive reinforcement or silicon. Longest toollife on GRP (80% glass) and CFRP.
PDC	**DP Compound**	Polycrystalline diamond (compound cutting material), carbide reinforced diamond of fine grit size, good cutting edge sharpness and low cutting pressure allowing for minor tolerances. Lower wear resistance at higher toughness.	Finishing of all nonferrous metals and nonmetallics with low content of abrasive reinforcement or silicon
PDC-S	**DP Compound**	Polycrystalline diamond (compound cutting material), carbide reinforced diamond of coarse grit size, good edge sharpness and low cutting pressure allowing for minor tolerances. Ideal for milling. Low wear resistance at higher toughness.	Finishing and milling of all nonferrous metals and nonmetallics with medium content of abrasive reinforcement or silicon.
PDC-CU-S	**DP Compound**	Solid polycrystalline diamond (compound cutting material) without carbide reinforcement, coarse grit size, good cutting edge sharpness and low cutting pressure allowing for minor tolerances. Well suited for milling tools with high depth of cut. High wear resistance at higher toughness due to large diamond volume.	Finishing and milling of all nonferrous metals and nonmetallics with high content of abrasive reinforcement or silicon. Highest material removal rate.

Cutting edge sharpness in comparison

The extreme cutting edge sharpness and its maximum diamond volume affect tool lifetime of the diamond cutting edge tremendously as a result of the extremely high thermal conductivity.

The newly developed laser technology offers great possibilities to produce such diamond cutting tools with TFC-CVD thick film and PDC diamond. Additionally all 3D geometries can be produced with the same cutting edge sharpness.

This development in laser technology and the production of the required diamond cutting materials makes us achieve our goal, which is the production of all necessary diamond cutting edges of highest quality with every optional chip control geometry without using a diamond grinding wheel.

We are among the world-wide leaders in the application of laser technology for the complete machining of diamond cutting edges.

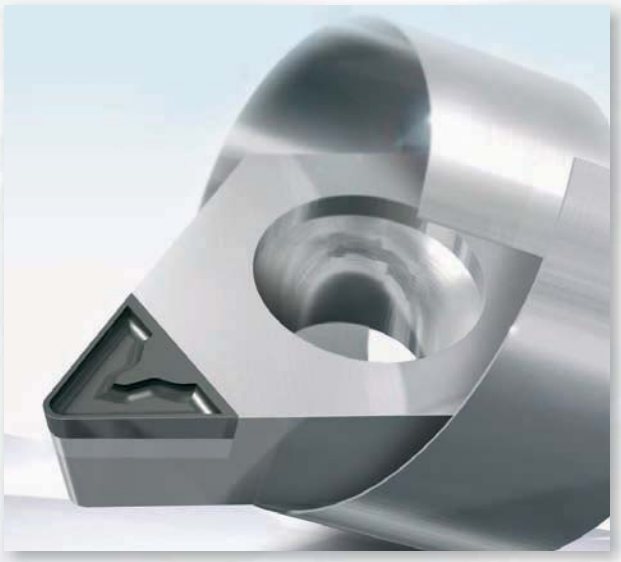
Top Rake Geometries

Top rake geometries		Diamond grade	Applications
	**CB 1**	**TFC** **PDC** **PDC-S** **PDC-CU-S**	**Slight cutting pressure** ■ Thin-walled or instable workpieces ■ Minor tolerances ■ Medium surface finish ■ Chip breakage
	**CB 2**	**TFC** **PDC** **PDC-S** **PDC-CU-S**	**Increased cutting pressure** ■ Solid or firm workpieces ■ Minor tolerances ■ Best surface finish ■ Chip breakage
	**Neutral**	**MDC** **TFC** **PDC** **PDC-S** **PDC-CU-S**	**Medium cutting pressure** ■ Solid or firm workpieces ■ Minor tolerances ■ Very good surface finish ■ No chip breakage, flow chip
	**Positive** **Neutral**	**MDC** **PDC** **PDC-S**	**Minor cutting pressure** ■ Thin-walled or instable workpieces ■ Minor tolerances ■ Medium surface finish ■ No chip breakage, flow chip
	**Positive** **R/L**	**PDC** **PDC-S**	**Minor cutting pressure** ■ Thin-walled or instable workpieces ■ Minor tolerances ■ Medium surface finish ■ High depth of cut ■ No chip breakage, flow chip

Cutting Data - Range of chip breaker application

CB 1:
Positive geometry for finishing and super finishing, ap: 0.05 mm to 1.5 mm. Applicable for smallest tolerances at lowest cutting pressure.
Application: thin-walled and instable workpieces.

CB 2:
Slightly negative edge preparation for roughing, semi finishing, finishing and super finishing, ap: 0.5 mm to 2 mm. Due to an increased cutting pressure and smallest tolerances a better surface quality can be achieved.
Application: thick-walled solid workpieces under stable circumstances.



3D-chip breaker design CB1 and CB2 = 3D-Spanbrecher-Geometrien CB1 und CB2									
Cutting radius	CB1 geometry				CB2 geometry				Cutting radius
	ap in mm		fz in mm/r		ap in mm		fz in mm/r		
	min.	max.	min.	max.	min.	max.	min.	max.	
0,1 mm	0,05	0,30	0,02	0,05					0,1 mm
0,2 mm	0,06	0,40	0,03	0,08	0,50	0,80	0,08	0,12	0,2 mm
0,4 mm	0,10	0,80	0,04	0,15	0,60	1,50	0,08	0,20	0,4 mm
0,8 mm	0,15	1,00	0,08	0,20	0,70	1,50	0,15	0,30	0,8 mm
1,2 mm	0,30	1,50	0,12	0,25	0,80	2,00	0,20	0,40	1,2 mm

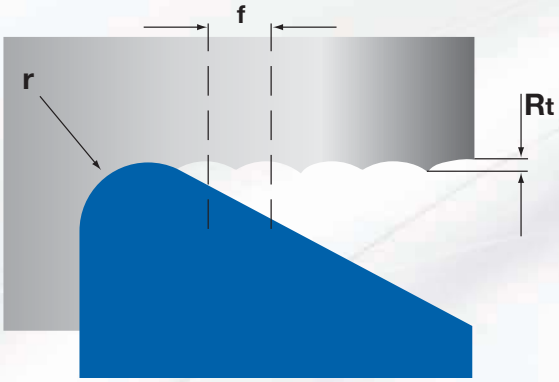
The indicated cutting data are recommended values resulting from a chip breaker with CB 1 and CB 2 geometries. The machining should be performed without fluid coolant when PDC and PDC-S cutting edges are applied.

Without 3D-chip breaker: Flow chips

With 3D-chip breaker: Breakage chips

Wiper Cutting Edge Geometry and Surface Finish

The theoretical Rt surface roughness value can be determined with the radius and the feed rates on hand. The required surface finish can be calculated very precisely in advance, provided all relevant peripheral prerequisites are given. As an example instable conditions of machine and/or workpiece, incorrect chucking, faulty or wrong tool system, wrong cutting speed and depth of cut etc. will all impair the results.

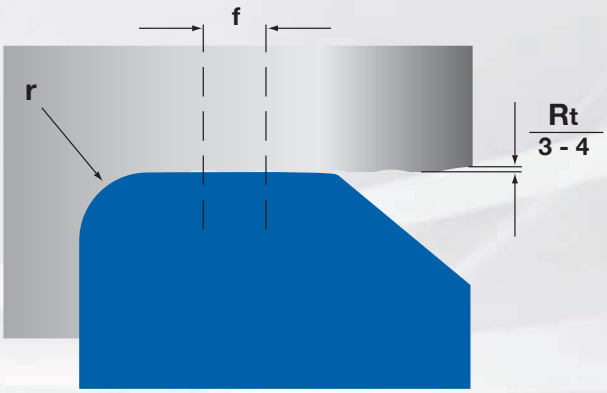


All values converted to µ

$$Rt = \frac{f_2}{8 \times r} \qquad r = \frac{f_2}{8 \times Rt} \qquad f = \sqrt{8 \times r \times Rt}$$

Theoretical surface roughness	Corner radius Feed rate per revolution (f = mm / rev)					
Ra	Rt	r = 0,2	r = 0,4	r = 0,8	r = 1,2	r = 1,6
0,6	1,6	f = 0,05	f = 0,07	f = 0,10	f = 0,12	f = 0,14
1,6	4	f = 0,08	f = 0,11	f = 0,15	f = 0,19	f = 0,23
3,2	10	f = 0,12	f = 0,17	f = 0,24	f = 0,29	f = 0,36
6,3	16	f = 0,16	f = 0,22	f = 0,30	f = 0,37	f = 0,45

A clear improvement of the theoretical surface roughness can be achieved with our Wiper geometry. For the high-performance cutting of all aspects we have developed a number of inserts with WIPER geometry for internal, external and milling processes. This WIPER edge replaces the minor cutting edge reducing its angle to a minimum, whereas it automatically improves the theoretically computed surface roughness by 2 to 4 times.

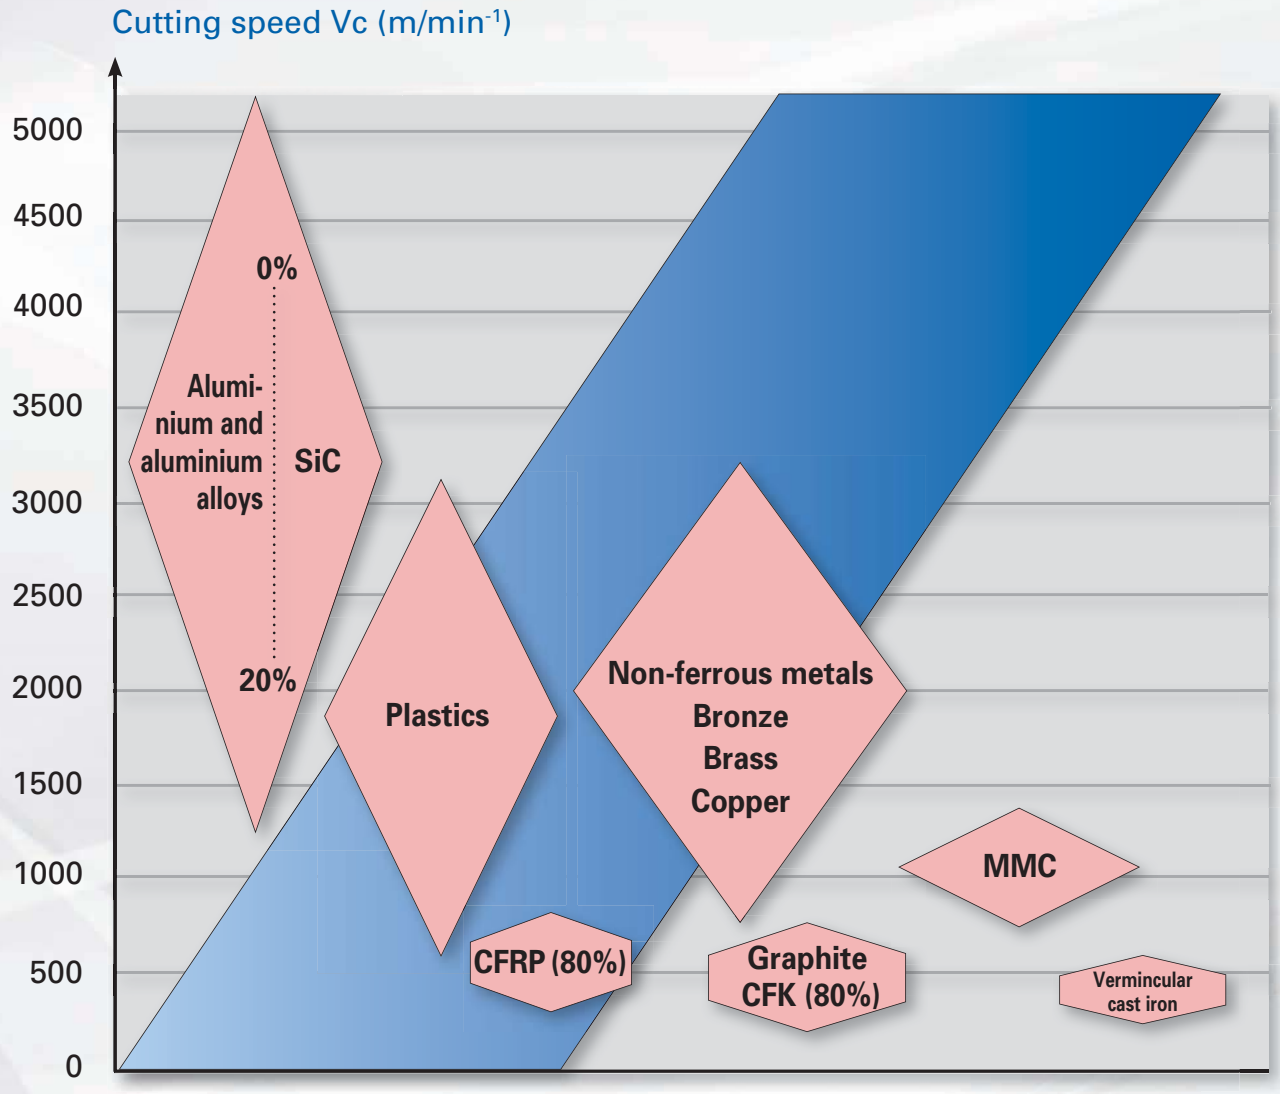


In practise these are the two possibilities
for high-performance and high-tech cutting:

1) 2-4x higher feed rate = same surface finish
2) same feed rate = 2-4x improved surface finish

Recommended cutting data

Turning and milling



Recommended values for turning

Diamond grade	Feed rate fz (mm/rpm)	Depth of cut
MDC	0,005 - 0,3 mm	0,005 - 1,5 mm
TFC	0,01 - 0,4 mm	0,01 - 2,5 mm
PDC	0,05 - 0,5 mm	0,05 - 3,5 mm
PDC-S	0,06 - 0,5 mm	0,08 - 5,0 mm
PDC-CU-S	0,08 - 0,8 mm	0,12 - 5,5 mm

cutting materials

Information

ISO turning and milling inserts

Our globally established product range of many years has on the one hand been partly condensed, but on the other hand been extended with our TFC-solid diamond and solid PDC-CU-S cutting materials including our extensive standard range of CB 1- and CB 2- 3D-chip breaker geometries. This has lead to a considerably-improved performance using challenging and very abrasive working materials. Please bear in mind that we have introduced new purchasing descriptions for our ISO inserts, replacing the letter "M" by the letter "G". According to the ISO-designation code this means a tighter tolerance class. The old descriptions can certainly still be used.

FormCut grooving range

This established grooving and turning programme has also been condensed on the one hand, but on the other hand it has been extended by the TFC-solid diamond as well as the PDC-CU-S solid grade. The 3D-chip breaker geometries CB 1 and CB 2 are available in our standard range and on enquiry. This enables us to increase the performance to a considerable extent. We also wish to point out the particular stability of our FormCut system.

MiniCut boring range

Our boring range has also been condensed and extended by the TFC-solid diamond cutting material. The tools are also available with 3D-chip breaker geometries CB 1 and CB 2. This increase in performance, particularly for boring depths of 7xD, are included in our standard range.

MillCut

Our MillCut range represents a new milling series tipped with the new TFC-Solid CVD diamond. All milling cutters without 3D-chip breaker geometry are in our standard range ex stock. We certainly also supply milling cutters with our 3D-chip breaker geometries CB 1 and CB 2 for special applications on enquiry. All milling cutters have a completely solid carbide shank with internal coolant feed onto the cutting edge. The cooling system is optionally available with fluid or air feed. All TFC-cutting edges are machined by the latest finish-laser technology with h8 tolerance.

Our TFC-MillCut tools have had their baptism by fire long ago and demonstrated their impressive performance, when it comes to cutting GRP with a glass content of 80%. A long-term cutting trial of GRP with 80% glass content on customer's site has shown a 100-fold longer machining period compared with identical carbide milling cutters. This has resulted in an uncatchable superiority in performance and improvement in quality alike. This superiority can also be said for cutting CFRP with 80% carbon fibre.

DiaMill-SPEED

Our new cutting series DiaMill-Speed broadens the possiblilities of high speed cutting. We apply the cutting materials TFC-solid CVD-diamond and solid PDC-CU-S as standard on our cutting inserts without 3D-geometry. If requested, we also supply the inserts with our 3D-chip breaker geometries CB 1 and CB 2. The cutters are made of 7075-T6 aluminium alloy with internal coolant feed onto the cutting edge and include the cartridges. These are factory adjusted at precisely 0.01 mm. Readjustment on site is to be avoided if possible and should only be carried out by qualified staff if need be. Our inserts type CPGW 09T304PDR-1 up to PDR-6 are precisely machined with the latest finish-laser technology and, when changed, do not require any time-wasting adjustment. The different PDR-geometries and the diamond cutting materials can be mixed up and assembled for sophisticated milling operations.

Information

DiaMill-ECO

The established cutting system DiaMill-ECO with steel body has been slightly modifi ed and offers unbeatable value for money. We have tipped the carbide blade with our TFC-solid diamond and with solid PDC-CU-S. Enormous cutting volumes can be easily achieved with the BFLP-wiper edge and the BFEK-design with large side cutting edges for cutting depths of 4 – 6 mm. The simple but highly-efficient design with internal coolant feed demonstrates convincing stability of the carbide milling blades. The surface finish achieved with the normal flank pitch design is very good due to professional selection of the various corner radius sizes up to 1.6 mm. The precise height adjustment of the blades can be set without problem by every setting device or calliper using the adjustment screw.

DiaMill-FEED

The DiaMill-ECO system has been advanced into the DiaMill-FEED. A massive key clamp is being applied and the number of cutting edges increased by at least 50%. All complete tool types DMFS and DMFL with HSK A63 as well as SK 40 are being fine-balanced in G 2.5 quality at maximum speed. The shell type milling cutters type DMFA are supplied factory pre-balanced and have to be fine-balanced by qualified staff using the applied milling arbor. We are happy to offer you our service to do this job for you. The tight flank pitch and internal coolant feed of our cutting insert types BFLP and BFEK ensure very good surface finish in high speed cutting mode and extremely long toollife as standard. This design has been widely applied in the field of engine production for years. The improved design makes expensive monobloc tools superfluous. The precise adjustment of the cutting inserts has to be set by a setting device or calliper as with DiaMill-ECO.

DiaMill-FLEX

As a special service we have the series DiaMill-FLEX on offer, which is a special design of the DiaMill-FEED design made according to customer's enquiry. In this case the measure of length L1 and L2 are being manufactured up to a length of approx. 220 mm according to your enquiry. At the same time the cutting diameter can be varied and adjusted keeping the flank pitch unchanged.

Application of the face and shoulder milling cutter head

When applying our milling cutter heads please observe the engagement width ae in accordance with the cutting diameter as well as the direction of the feed rate.
If possible, all PDC-inserts should be run in down-cut milling mode. In contrast our TFC-solid diamond inserts can be run in up-cut milling mode without restriction. However the feed rate has to be higher than in down-cut milling mode.

milling Ø Dc mm	milling width ae mm
40	20 - 30
50	30 - 40

Contray to most conventional tool systems we use positive indexable insert types EPHW / EPHT 0401.. and 06T1.. with a 75 style. This established insert type make us achieve best-possible performance for boring. Our solid carbide boring bars allow for a boring depth of 7xD with the highest precision and surface finish.

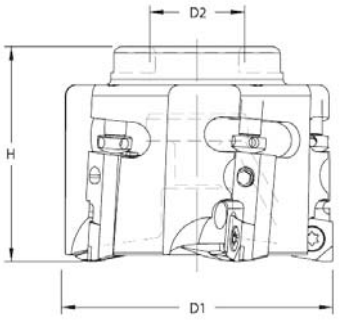
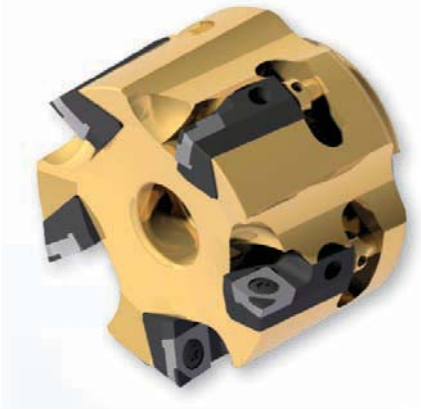
MILLING | DiaMill-SPEED

TCP90

Aluminium face milling cutter program engineered for high speed machining of all non-ferrous materials.





All milling cutters are supplied with factory micro-adjusted cartridges.

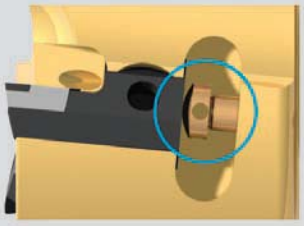
order number	D_1 [mm]	D_2 [mm]	H [mm]	flutes	n max: Rotation/min	HSC max: m/min	insert
TCP90-50MM-AL	50	22	50	3	27.000	4.239	CPGW-09T304PDR
TCP90-63MM-AL	63	22	50	5	23.000	4.550	
TCP90-80MM-AL	80	27	50	7	18.000	4.522	
TCP90-100MM-AL	100	32	50	10	17.000	5.338	
TCP90-125MM-AL	125	40	50	11	15.000	5.888	
TCP90-160MM-AL	160	40	50	13	12.000	6.029	
TCP90-200MM-AL	200	50	50	16	11.000	6.908	

- Milling cutter bodies made from lightweight 7075-T6 aviation grade aluminium
- Maxicool through coolant enables for maximum chip evacuation and temperature control
- Ultra precise finishing with unique wiper-radius inserts, tipped with TFC-Solid-Diamond and PCD-Cu-S grade and micro adjustable cartridges.

Security Features

Insert Double Lock	Cartridge Dovetail Lock	Enclosed Cartridge Clamping Screw
		Secondary insert step locks against matching step on insert cartridge Designed to act as a double lock in conjunction with the insert tapered screw	Insert cartridge is fitted into cutter body with dovetail design Centrifugal forces acting on insert cartridge are neutralized by wedge profile of cartridge and matching shape on cutter body	Unique cartridge shrouds cartridge clamp screw within steel body Potential screw breakage is contained within steel of cartridge – the screw has no place to eject

Performance Features

Micro Adjustable	Through Coolant Enabled	Wiper Radius
		


Easily pre-set cartridges to within microns All milling cutters are factory pre-set in height to within +/- 0,01 with a master gauge insert	Coolant ports are directed at the cutting edge to external tool life and improve surface finishes	Unique wiper is a compound radius that outperforms traditional wiper flats With every insert in the cutter loaded with the wiper radius, super finishing is easily attained

Accessories

Coolant caps

- Optinal coolant caps avaible for larger cutter diameter to provide 360° direct coolant supply at the cutting edge.
- Balanced by design and mounted securely to maintain constant coolant supply at maximum RPM.
- Made from the same lightweight 7075-T6 aviation grade aluminium as cutter bodies for reliable long term use and service

540% Increase in toollife using TFC-Solid Diamond

Application:
Milling the face of a cast aluminium oilpan. Material is a A380 Aluminium consisting of 9% silicon.

Cutting Data:
100 mm diameter cutter (Z=10)
8000 RPM (through tool coolant)
5420 mm/min feedrate
1-2 mm D.O.C.
Rz = 1,8 micron

Part life:
PDC-S = 2.500 pieces
TFC = 13.500 pieces

Recommended application

Our 6 different milling inserts of type CPGW 09T304-PDR 1 up to type CPGW 09T304-PDR 6 differ only slightly in the respective wiper edge geometry.

However we can reach a broad application field in connection with our Diamond cutting materials TFC-Solid-Diamond und the grade PDC-CU-S.

Spare parts for DiaMill-FEED, see page 54

The face- and shoulder milling cutter of the DiaMill-FEED and DiaMill-FLEX types are always factory fine-balanced at G 2.5 at maximum speed (see diagrams) according to ISO 1940/1. Please bear in mind that for safety and quality reasons it is absolutely to be avoided to release and shift the balancing weights. In case of necessary follow-up balancing, please only allow for skilled staff to attend to it.

For more information, please see page 13

Face- and Shoulder Milling Cutter 90°

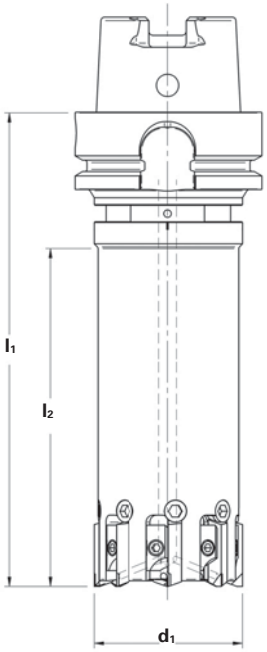
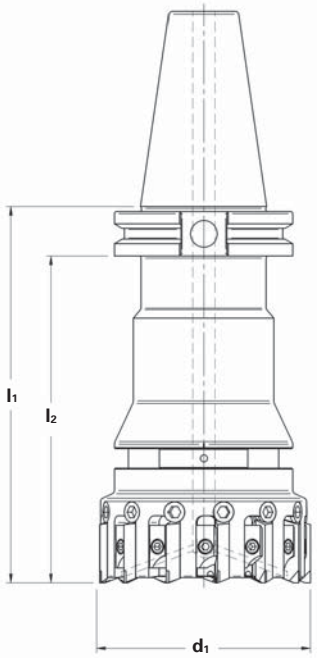
integral design HSK-A 63 and SK 40
Type DMFL with through coolant
fine-balanced G2,5
Diameter 40 - 80 mm

Upon Request

In order to react quickly to all milling applications we offer our DMFL-series as special design to our customers. In this case the measures of length l_1 und l_2 can be determined individually.





order number	dimensions							milling blades

We only use one single milling blade for our milling systems DiaMill-ECO, DiaMill-FEED as well as DiaMill-FLEX. The solid carbide blades are tipped with our TFC- Solid-CVD-Diamond as well as our solid PDC of grade CU-S. The superfinishing of the cutting edges is done via laser technology.
The utterly stable total built of the cutter heads as well as the solid carbide milling blades enables a highly-effective material removal rate with extremely-long toollife.
For more information, please see page 13

Trouble Shooting

Trouble shooting diamond cutting edges		
Problem	**Possible cause**	**Suggested action**
Poor surface finish	Vibration	Check rigidity of toolholder, clamping-system and machine
	Too high feed r ate	Lower feed rate, increase nose radius or change to a wiper edge
	Wrong diamond grade	Use PDC grade with finer grain size, or use TFC or MDC
Extreme flank wear	Too high cutting speed	Decrease speed according to cutting data tables
	Wrong diamond grade	Use PDC-grade with coarser grain size or use TFC or MDC
Edge chipping	Vibration	Check rigidity of toolholder, clamping system and machine
	Wrong cutting data	Check speeds & feeds in cutting data for your application
	Wrong grade	Use PDC-grade with coarser grain size (PDC-S or PDC-CU-S))
Loosen the diamond tip	Excessive cutting temperature Excessive flank wear	1. Increase coolant to tip and holder (air or fluid coolant) 2. Reduce speed and depth of cut 3. Use TFC grade
No chip breakage despite chip breaker geometry	Wrong cutting data	1. Check cutting data according to table on page 9 2. Use fluid coolant

In addition to the recommendations in this catalogue, the following general rules apply to diamond cutting edge applications:

- Rigid set-up of machines and tools
- Ensure best-possible coolant supply to tip due to thermal resistance of diamond up to only about 700°

Please observe our full range of tools with ultrahard cutting materials
